Western Kentucky University Stormwater Utility Survey 2024

C. Warren Campbell

SCHOOL OF ENGINEERING
& APPLIED SCIENCES

Cover

The cover flood picture is taken In May 2024 at Hoover Dam, one of the greatest multi-objective engineering projects of all time. The cost of construction plus interest was completely paid by the sale of power generated by the dam. It provided flood protection, power, and badly needed jobs during the depression at the cost of many lives. The “official” death toll is 96, but does not include deaths from heat exhaustion, carbon monoxide poisoning from working in the tunnels, heart attacks, and deaths that did not occur on the work site. Regardless, this is the project that showed how to build large dams. There are larger, higher dams in the world today, but this engineering marvel paved the way for them.

Preface to the 2024 Survey

Some larger cities have now enacted stormwater utilities, including Boston and Pittsburgh, while New York City and New Orleans are considering them. Meanwhile, some cities considered one and voted it down. Dover had the opportunity to become the first stormwater utility in New Hampshire, but the city council voted against it. Considering a stormwater utility is not the same as enacting one. Some cities have considered one for years, Honolulu being one example, but have not yet found the political wherewithal to act. Some of these cities will have to wait for the next big flood or water pollution event to develop the political will and support to move forward.

It is unfortunate that humans tend to be reactive rather than proactive. I can make the case that the greatest flood problem in the U.S. and perhaps the world is a failure to understand flood risk. I see it all the time here in Bowling Green where developers build, and buyers buy in areas that will flood. As Andy Reese has pointed out many times, stormwater is the forgotten infrastructure. Every drainage system in the world works perfectly when it is not raining. Citizens ask why a stormwater fee is needed years after the last major storm, and then after the next major flood scream that the city has known about this problem for years and did nothing about it. In these cases, community officials must make their plans, deal with the highest priorities as funding allows, and wait for a flood to generate political will.

The purpose of this survey is to provide data to communities interested in having consistent, fair funding for their flood control and water pollution mitigation efforts. Years ago, when I was the city hydrologist for Huntsville, Alabama, I became convinced that a stormwater utility was the best and fairest method to fund our flood mitigation efforts. I needed data like that provided here. I believe it is worth the effort involved.

Most of the data provided in this survey come from scouring community websites and online municipal codes. This means that some of the fees are out of date. Keeping track of more than 2000 utilities is a massive job. For that reason, as always, I appreciate corrections from readers. Probably the smaller community fees are more suspect. When fees increase, media coverage of fee increases frequently occurs. Smaller communities do not have the same media coverage. Please send your information to warren.campbell@wku.edu.

Warren Campbell

May 28, 2024

Methods

The main goal of this survey is to identify as many U.S. Stormwater Utilities (SWUs) as possible. Because many stormwater professionals do not have the time to respond to questionnaires, our primary method of identification was Internet searches. We searched key terms such as “stormwater utility,” “stormwater fee,” and “drainage fee.” We scoured online municipal codes such as Municode, AmLegal, Sterling, LexisNexis, General Code, and others. We searched through many city web websites to find utilities. We have also had many people contact me to update fees and identify new utilities. However, the data primarily comes from Internet sources and is prone to errors. Some community websites are not very clear on whether the fee given is monthly, bi-monthly, quarterly, or annually. In cases like that, we made the best guess we could. We hope the readers of this document will continue to help us correct mistakes. However, it is difficult to keep up with fee changes in more than 2000 utilities, so if you discover errors in our data, please contact me at warren.campbell@wku.edu.

ACKNOWLEDGEMENTS

We are indebted to the Wisconsin chapter of the American Public Works Association for their excellent survey of Wisconsin SWUs (Wisconsin APWA [2019]). Thanks to Mike Gregory of Computational Hydraulics International for his updates on Canadian stormwater utilities. For several years, he has been my complete source for Canadian SWUs. Because of his contribution, he really should be a co-author. I offered that, but he declined. In any case, thank you, Mike. Also, the University of North Carolina Environmental Finance Center has identified several SWUs that I have included in this survey. I also want to thank Andy Reese of AMEC (now Wood) for showing me several SWUs as well. Black and Veatch (2021) publishes an excellent stormwater utility survey with more detailed information about the SWUs in their survey. In 2021, 73 SWU communities responded to their survey. It is a very worthwhile survey and should be read by anyone interested in stormwater utilities.

The author is grateful to Professor Randel Dymond and his graduate students Kandace Kea and Amanda Dritschel at Virginia Tech for the work they did on past surveys and the database.

Since 2007, many of the SWUs in this survey were identified by our undergraduate students who are listed below. I am very proud of the fact that 66 of my students have passed the Certified Floodplain Manager (CFM) exam. When I came to Kentucky in 2004, I was the 7th CFM in the state. There are 11 states with fewer than 64 CFMs, so we are making a contribution to floodplain management.

The authors are grateful to all of these students who have participated in the survey over the past years. They have worked diligently at a somewhat tedious job, but one that should have taught them something about stormwater financing, municipal codes, and websites.

We are also indebted to AMEC for sharing their list of stormwater utilities with us. In 2008, Scott Embry had the foresight to ask them for it and they obliged. We continue to have a good relationship with AMEC and with Andy Reese.

We also wish to thank the Environmental Finance Center of the University of North Carolina which provided data on several North Carolina and Georgia stormwater utilities (Environmental Finance Center, 2013).

Several companies publish municipal and county codes which serve as a source for much of our data. We are particularly indebted to the Municipal Code Corporation, Code Publishing Company, American Legal Publishing Corporation, General Code, Lexis Nexis, and Sterling Codifiers, Inc.

Introduction

We have been able to identify 2135 U.S. stormwater utilities (SWUs) that have formed nationwide, and Mike Gregory found 73 in Canada. There are now 2 states with more than 200 stormwater utilities (SWUs) and nine with 100 or more SWUs. Minnesota leads with 229. Figure 1 shows U.S. stormwater utilities by location.

Some larger cities have formed stormwater utilities, including Boston and Pittsburgh. New York and New Orleans are considering them, but considering and enacting them are not the same. Anchorage did a feasibility study in 2018 and has not yet enacted one. There is a long step between feasibility studies and enactment that requires considerable political wherewithal. Huntsville, Alabama, performed a flood mitigation study in 2001, that recommended a stormwater utility to fund their flood mitigation efforts. The community faced several political hurdles and still does not have one. A major flood will be required, and/or a change in community leadership will be required to reconsider a SWU.

Forty-two states plus DC have enacted SWUs. One community official once said to me, “We are too small to have a stormwater utility.” The smallest community with a stormwater utility that we have found is Indian Creek Village, Florida with a 2020 census population of 84 (no, this is not a misprint). The largest community is Los Angeles County with a population of over 10,000,000. The average SWU community population is 65,145, and the median is 16,243. These numbers are almost certainly too large because it is difficult to find stormwater utilities in small communities because their web pages often do not provide much information. We were able to find a few communities with populations under 5000 using online code publishers like Municode. The bottom line is that no community is too small or too large to have a stormwater utility.

At some point, this survey will become unnecessary as every community will have some appropriate stormwater funding mechanism. When will this occur? We have identified 2135 SWUs in the U.S. and 73 in Canada, and in June 2019, there were 22,389 communities participating in the National Flood Insurance Program (NFIP) (FEMA’s Community Status Book: <https://www.fema.gov/cis/nation.pdf>). This survey will be necessary for the foreseeable future.

The Data

Part of our raw data is contained in the Table in Appendix A. As this is written, our survey contains data on 2135 stormwater utilities (SWUs) located in 42 states and the District of Columbia (Figure 1). Based on our current find rate, my best guess would be that there are at least 2500 SWUs in the U.S. and, quite possibly, 3000. More are being formed all the time, and we are aware of several that will form within the next few months.

Once a stormwater utility is enacted, it is often challenged politically or in court. For example, Colorado Springs enacted a stormwater utility some years ago. Opportunistic politicians ran on the platform of repealing the “rain tax.” They won, and then it was repealed. Apparently, realizing their mistake, it was re-enacted. In all, I have only found 13 SWUs that have been repealed. Some of these occurred because of state court decisions. The officials in more than 99 percent of these communities apparently feel that they are a good idea. In my experience, most politicians are focused on one thing: re-election. This means that their governance usually reflects the will of the majority of voters in their districts.

Figure 2 shows the number of stormwater utilities by state. Politics does not seem to play a role in stormwater utility formation. If SWUs were electoral votes in 2020, Trump would have won 1227 to 991. It is interesting that conservative states have more stormwater utilities than more liberal states. At least 9 states have more than 100 SWUs. Democratic-leaning Washington, Wisconsin, and Minnesota have more than 100 SWUs, while conservative-leaning Texas, Ohio, Iowa, Indiana, North Carolina, and Florida also have more than 100. Three of those states went for Biden in the 2020 election, and six went for Trump. Of the no-SWU states, 4 went for Biden and 3 for Trump.

Nationwide, the average monthly single-family residential fee was \$6.19, the standard deviation was \$4.87, and the median fee was \$5.00. Most fees go up over time, reflecting an increase in the Consumer Price Index (CPI). Some communities tie the monthly fee to the CPI. However, a few communities have reduced their fees. The quartile fees are 25%—\$3.12 and 75 %—\$7.50, with an interquartile range of \$4.48.

Fees ranged from zero to \$46.71 per month. Figure 3 shows the spatial distribution of monthly fees. As has been observed in previous surveys, no state has all high fees. Even states with higher fees also have utilities with much lower fees. The range of fee amounts probably reflects stormwater needs and local political realities.

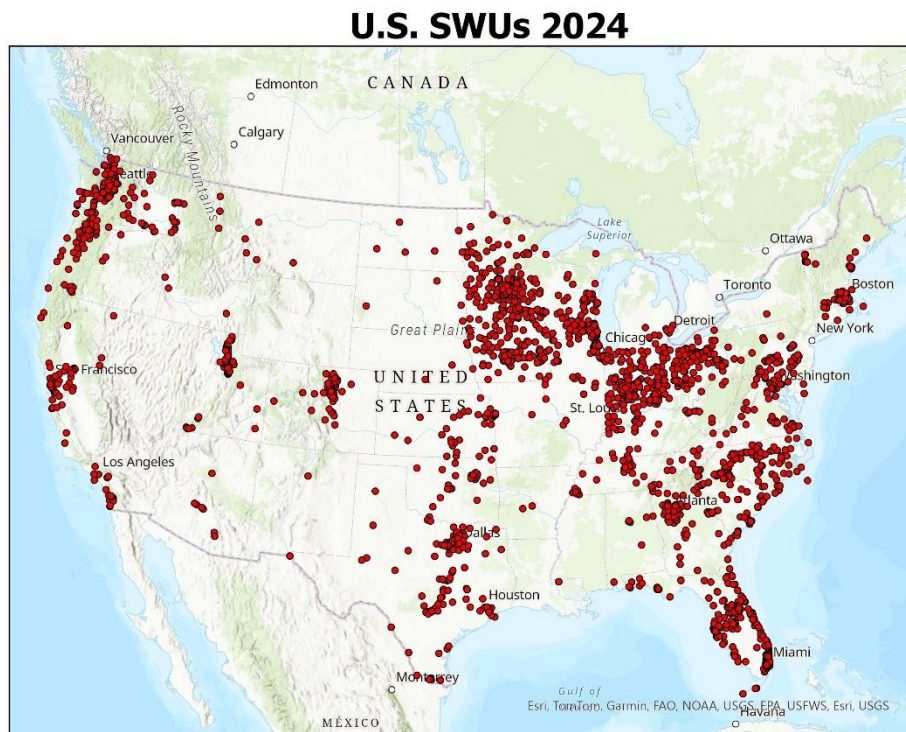

Figure 1. U.S. stormwater utilities (SWUs).

The most widely used method of funding is the ERU system (Figure 4) comprising about half of all SWUs. An Equivalent Residential Unit is usually the average or median impervious area on a single-family residential parcel, although some communities define it as the average of all residential parcels. Fees for non-residential properties are proportional to the ratio of the parcel's impervious area to the ERU. For the ERUs identified in our survey, the average was 3128 sq ft of impervious area, the median was 3000 sq ft, and the standard deviation was 1413 sq ft. We were able to find ERUs for 1053 utilities, which is just under half of all the SWUs. It is important to have a good estimate of the ERU because an inaccurate ERU means that someone is paying a disproportionate amount, which could increase legal exposure (Campbell [2010]). The second and third most popular fee systems were the flat fee (251 SWUs) and the tier fee (245 SWUs) systems. Next in popularity was the Residential Equivalent Factor (REF) system, with 150 identified. We were able to identify 119 Dual Fee systems.

A few communities use ERU systems with a cap. For example, I am aware of one community with an ERU system that caps at \$60. In that community, at least one property owner should be paying 10 times that \$60 cap per month. In a community like this, the residential customers will be paying much more than their fair share of the cost of the stormwater program. This increases the legal exposure for the community.

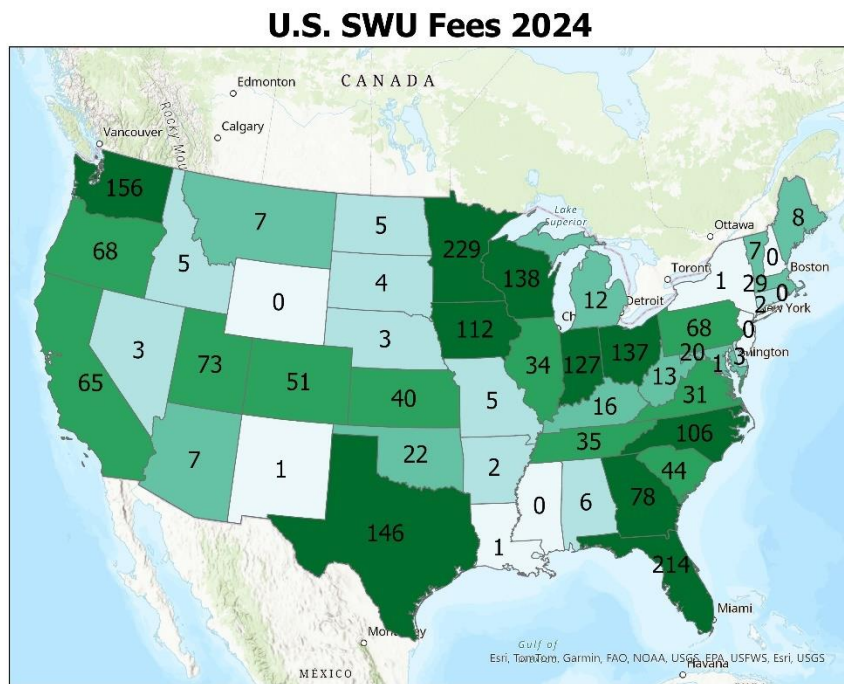

Figure 2. The number of stormwater utilities by state.

Figure 5 shows that the 9 states with more than 100 SWUs make up significantly more than half of all SWUs in the U.S. One of the mysteries of stormwater utility formation is the question of why they form

readily in some states and not in others. Figure 6 may shed some light on this mystery by showing SWU underachievers and overachievers. The plot shows the number of SWUs in a state versus the date of formation of the first SWU. To have 100 or more SWUs, the latest date of formation is 1993. The chart also shows that Michigan formed the first SWU in 1979, yet only has 12 SWUs. This may be in part due to a lawsuit filed and won against the Ann Arbor SWU. A spectacular overachiever is Pennsylvania, which formed its first SWU in 2011 and already has 68 SWUs.

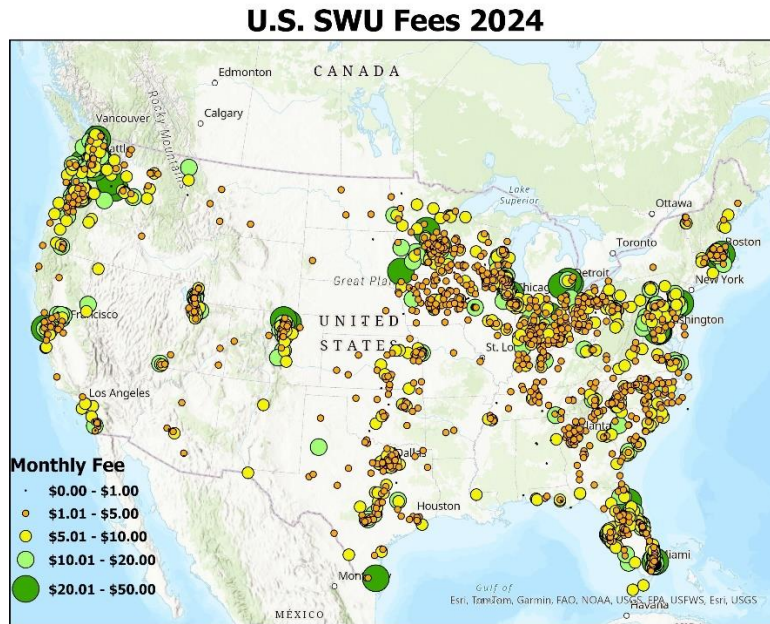

Figure 3. Spatial distribution of monthly stormwater fees.

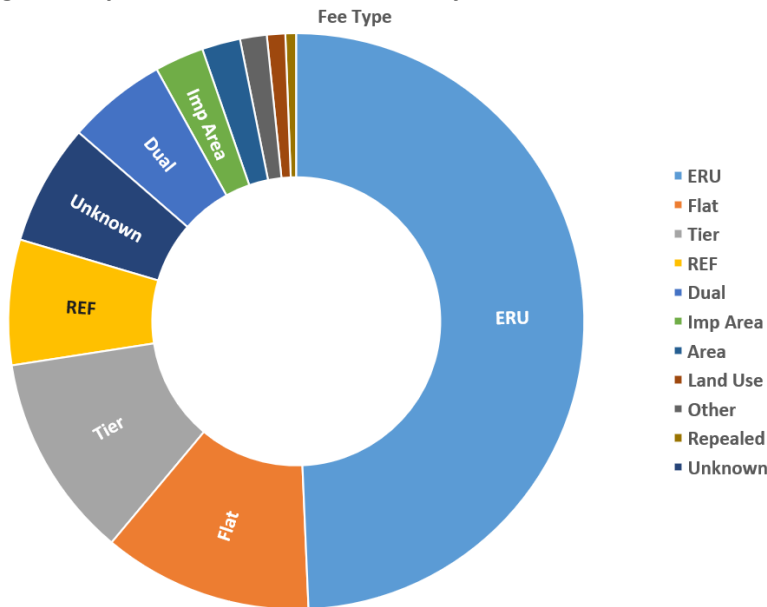

Figure 4. Stormwater utility fee types

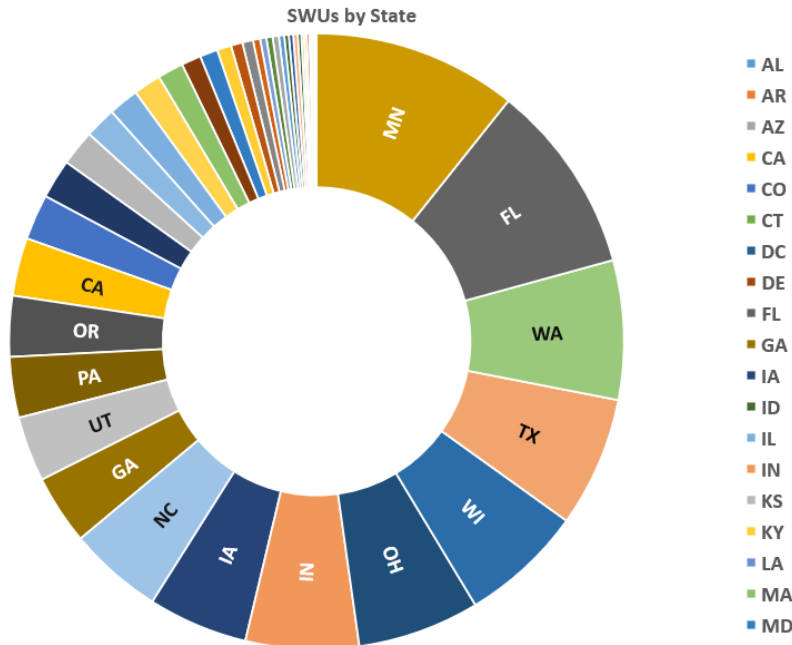

Figure 5. Stormwater utilities by state

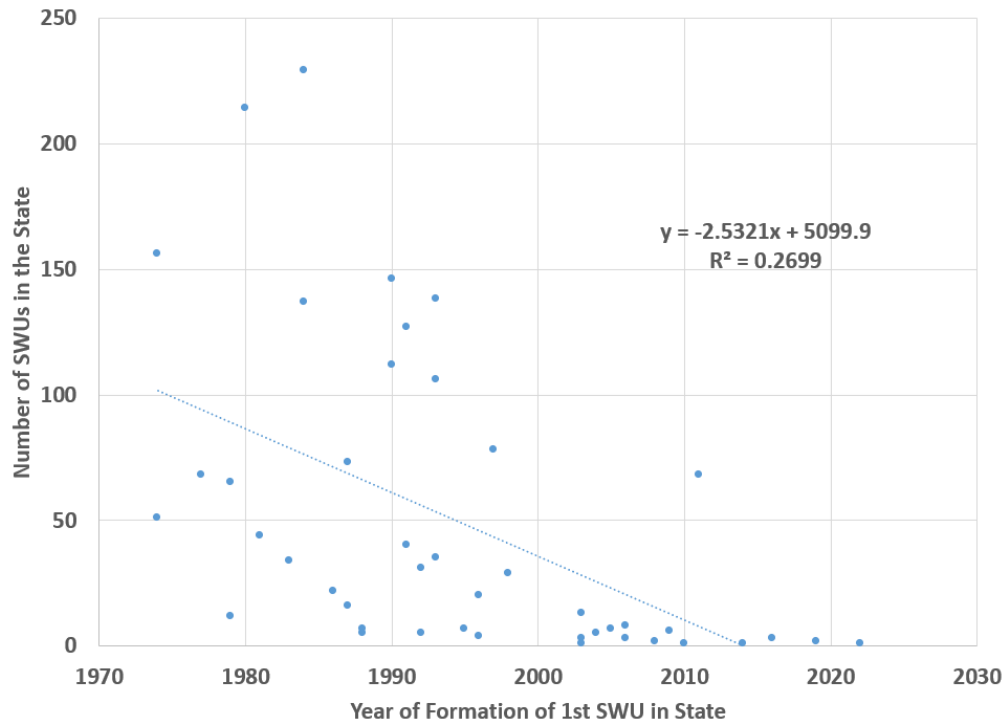

Figure 6. Stormwater utility numbers against the year of formation of their first SWU

Canadian Stormwater Utilities

Mike Gregory found 73 Canadian communities with stormwater utilities. From Figure 7, SWUs in Canada seem to cluster mostly in tight groupings near metropolitan areas. The average fee was \$12.17 Canadian, and the median was \$9.42. The median population of a SWU community was 33,500.

Comparing U.S. SWUs and Canadian SWUs, we see several differences. The ERU fee was most popular in the U.S. but was much less popular in Canada, where only 4 of 73 used it. The most popular fee there was the flat fee, with 24 of 73 using it. followed by the dual fee, with 18 using it. The median population of a SWU community in Canada was 2.1 times larger than the median population in the U.S.

Figure 8 provides the distribution of Canadian monthly fees in Canadian dollars. All information to create these maps was provided by Mike Gregory, Engineering Director for Computational Hydraulics International.

Canadian SWUs 2024

Figure 7. Canadian communities with stormwater utilities.

Canadian SWU Fees 2024

Figure 8. Canadian monthly fees (Canadian \$).

Figure 9 shows that the popularity of different fee types in Canada is significantly different from that in the U.S. While ERU fees make up about half of all fees in the U.S., they come in at number 6 in Canada. Flat fees are the most popular, followed by dual fees and ad valorem fees. There are 6 times as many flat fee communities as there are ERU communities. Interestingly, the median population of the four ERU communities is 204,900, or more than 6 times that of SWU communities as a whole. We speculate that one reason for this is that larger communities have more resources to develop the data required for ERU fee systems.

Figure 10 shows the number of stormwater utilities by province. Alberta has the most, 32, followed by Ontario with 22 and British Columbia with 14.

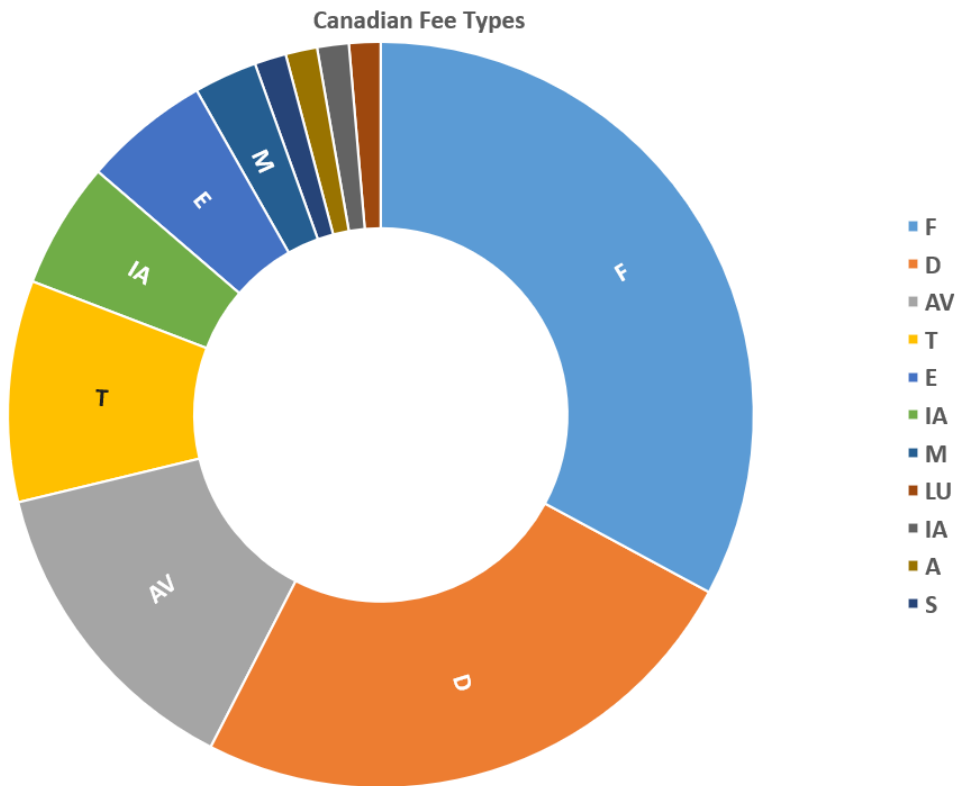

Figure 9. Canadian fee types

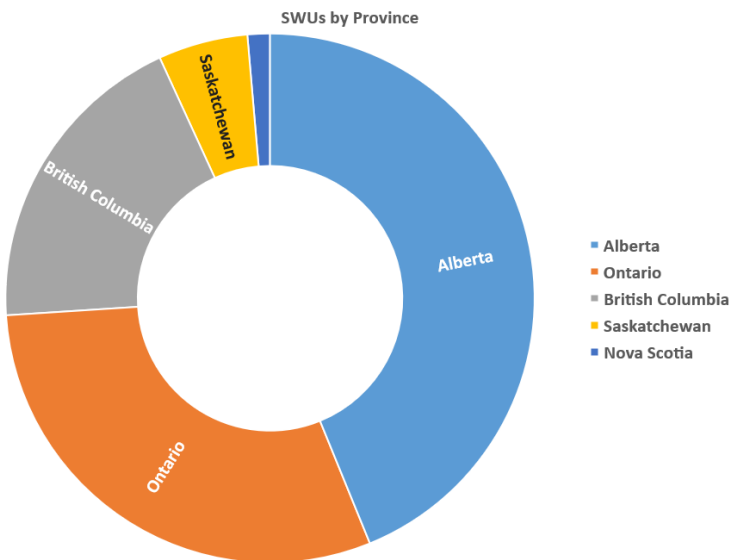

Figure 10. Stormwater utilities by province

Stormwater Financing

There are many ways to fund stormwater programs, but we strongly support stormwater utilities for reasons that will become clear from this discussion. The most popular method is through a community's general fund. That is, through sales tax, property tax, or income tax. The problem with this type of

funding is that stormwater must compete with fixing potholes, putting more police on the street, and other community priorities. Stormwater is the forgotten infrastructure since every drainage system works perfectly when it is not raining. Community officials want to spend taxpayer money on immediate priorities, and until the next flood these priorities do not include stormwater. Voters do not give political support to expenditures they do not perceive as important. Media are all about viewership and readership. "If it bleeds, it leads" is their mantra. When it has been years since the last major flood, media lose interest in flood problems, because their viewers and readers lose interest. Stormwater falls victim to a perfect storm of disinterest.

Another way to fund stormwater is through an addition to the property tax. This is the method used by the Maricopa County, Arizona Flood Control District (outside of Phoenix). The good news is that every year they can adjust the percentage of the property tax that goes to flood control; the bad news is that every year they must beseech their elected officials to give them the financial support they need. Few elected officials are motivated to increase taxes.

Clark County, Nevada (Las Vegas) has another approach. They use an addition to their sales tax. When this was proposed, it passed by a 2 to 1 margin. Why not let visitors to Las Vegas pay for their flood control? This was very politically popular. The problem is that the income for the Flood Control District goes up and down with the local economy. Prior to the bursting of the mortgage bubble, the District received \$90M each year. When the bubble burst, their annual revenue fell to \$60M.

There is a more general problem with the Maricopa and Clark models. They use *ad valorem* assessments. There is no nexus between the fee and the service rendered. This is easiest to illustrate with a property tax example. You might be able to build a 100-story building on a 5-acre parcel for \$1B. On the same parcel, you might be able to build a parking lot for \$1M. If the flood control fee is based on property taxes, the 100-story building owner would be paying 1000 times that of the parking lot owner even though they both produce the same amount of stormwater runoff.

By contrast, a stormwater utility fee can be made fair, though it is not a given. Many fees are based on the amount of impervious area (IA) within the parcel. This includes the building footprint, sidewalks, parking lots, etc. The theory is that the amount of stormwater produced is strongly correlated with the amount of IA. The gold standard for fairness of fees based on IA is Arvada, Colorado and a handful of other communities across the U.S. These communities have estimated the IA on every parcel in town. The fee paid is proportional to the impervious area on the parcel. This system is very fair but complex to administer because every parcel has a different fee. The community's GIS system must be very sophisticated.

At the other end of the spectrum is the flat fee, which means every parcel in town pays the same fee. This system is the easiest to administer because every fee is the same, but it is also the least fair of any SWU system.

The Equivalent Residential Unit (ERU) system is a compromise between the highly complex, highly fair Arvada system and the flat fee system. An ERU is the average or median impervious area of a single-family residential parcel. Often, every residential property will pay the same fee, and nonresidential properties will pay according to the number of ERUs on the parcel. For example, if the base fee is \$5.00 per month, and the ERU is 3000 square feet, then a store with 30,000 square feet of IA has 10 ERUs. The store owner would pay \$50 per month. Residential parcels may account for 90 percent of the parcels in

town, so those parcels may all receive a single fee. The IA for nonresidential parcels will all have a different fee, but the GIS overhead is much less.

Summary

Forty-two states and DC have stormwater utilities. Communities in Alaska and Hawaii are also considering stormwater utilities. There are probably at least 2500 SWUs in the U.S., with possibly as many as 3000. At least 73 have been enacted in Canada. A state's political leaning does not correlate with the number of SWUs in the state.

Many SWUs are challenged in court or repealed by opportunistic elected officials. Regardless, SWUs can be the fairest method of funding flood and water quality programs if the fee systems are set up correctly. Many are not. Any community wanting to set up a SWU should contract with a company that does many of them. At least one company has helped many communities enact stormwater utilities that have never been successfully challenged in court. In this report, we suggested setting up stormwater utilities to reduce legal exposure. It is our hope that communities will take them to heart.

If you are a community official wishing to enhance your flood control or water quality programs, I have the following suggestions for setting up a stormwater utility.

1. Work with a company that sets up many SWUs. They are the experts.
2. Use flat fees only to raise money to hire these experts, then go to a fairer system like the ERU system.
3. Put teeth in your ordinance. If state law allows it, turning off water and power rather than taking nonpayers to court will be a more effective strategy.
4. Determine the level of service you want to provide, determine how much it will cost, and set your base fee accordingly.
5. Make your case and identify the town's first beneficiaries. Enlist their support at public meetings.
6. Make a powerful elected official your champion.

Appendix A. U.S. Stormwater Utilities

The following data tables provide the information collected on 2135 U.S. stormwater utilities and 73 Canadian ones. Note that ERUs in the Canadian SWUs are in square meters impervious. The key for the fee types is given below.

Code	Meaning
IA	Impervious Area
E	ERU
F	Fixed Rate
T	Tier System
R	Residential Equivalence Factor (or similar)
D	Two Level System (Residential/Commercial)
X	No information
S	Fee per Parcel Square Footage
A	Fee per Parcel Acre
-	Repealed
W	By Water Usage
M	By number and size of water meters
AV	Ad valorem fee
LU	Land use-based fee
ID	Intensity of development
PT	Parking spaces in tiers
PI	Pervious and Impervious area
O	Other – does not fit other categories

No	Community	State	Fee	ERU	Fee	Year	Pop
1	Anniston	AL	IA		\$0.83	2014	22,112
2	Birmingham	AL	T		\$0.83		212,157
3	Jefferson County	AL	F				
4	Madison	AL	IA		\$0.83	2014	48,861
5	Mobile	AL	E		\$0.83	2009	195,111
6	Montgomery	AL	IA		\$0.83	2016	199,518
7	Bryant	AR	D		\$5.00	2015	20,194
8	Hot Springs	AR	D		\$4.25	2008	35,680
9	Flagstaff	AZ	T		\$4.69	2003	68,667
10	Mesa	AZ	F		\$7.32	2006	462,821
11	Oro Valley	AZ	E	4000	\$4.50	2008	41,627
12	Peoria	AZ	F		\$1.00	1995	154,065
