The Abdominal Musculature and Cycling Performance

Purpose: Our purposes were to determine if abdominal power and endurance were related to anaerobic and aerobic cycling performance and to evaluate if abdominal fatigue affects the aforementioned cycling parameters. Methods: Twenty three college aged subjects had their age (19.17 ± 0.98 yrs), height (170.41 ± 7.54 cm), and weight (74.48 ± 14.06 kg) taken and completed the front abdominal power throw and ACSM Crunch test so we could evaluate their abdominal power and endurance, respectively; the tests were completed twice across 48 hr to attenuate any learning effects. Twelve of the subjects completed the Wingate anaerobic power test on a Monark 834 E ergometer set at 7.5% of body mass. The remaining 11 subjects completed a 3 km cycling time trail (TT), an aerobic cycling test, on an Expresso S3U virtual reality bike. Subjects completed familiarization, baseline, and performance trials for the cycling measures; immediately before the performance trials, subjects completed abdominal crunches to fatigue. All tests were preceded and followed by a warm-up and cool-down. Dependent t-tests were used to assess differences between baseline and performance cycling trials, whereas correlational analyses were used to evaluate the relationships between abdominal and cycling measures; a was set at 0.05. Results: Abdominal muscle fatigue significantly decreased mean anaerobic power (p = 0.000) and rate of fatigue (p = 0.004); the decrease in peak power approached significance (p = 0.088). Abdominal muscle fatigue didn’t affect TT performance; however, after fatigue, abdominal power was significantly correlated to TT mean power and time (r = -0.708 and 0.704, respectively). No other significant correlations were found before or after fatigue between the abdominal and cycling measures. Conclusion: The data show that abdominal fatigue affects anaerobic cycling performance in our subject population; consequently, individuals may wish to avoid fatiguing abdominal exercise prior to anaerobic power tests or competitions that include anaerobic power elements.
